Computational tools for bioacoustic research

Dr Dori Grijseels
Malkemper lab
Max Planck Institute for Neurobiology of Behavior

Goal of the workshop

- Understand different steps of bioacoustics analysis pipeline
- Have an overview of available tools and resources for further reading
- Able to run a basic pipeline on bioacoustics data using Python

Goal of the workshop

- Understand different steps of bioacoustics analysis pipeline
- Have an overview of available tools and resources for further reading
- Able to run a basic pipeline on bioacoustics data using Python

What it is *not*

- Coding or Python lesson
- Tutorial on one particular tool
- Definitive or only way to do bioacoustics analysis

Goal of the workshop

- Understand different steps of bioacoustics analysis pipeline
- Have an overview of available tools and resources for further reading
- Able to run a basic pipeline on bioacoustics data using Python

Accompanying wiki and code available here:

https://github.com/DoriMG/AnimalBehaviourLiveWorkshop

Schedule for workshop

- Theoretical introduction of topics (10 mins)
- Follow-along practical guide (30-35 mins)
- Questions (10-15 mins)

Resources for the workshop

This presentation

GitHub wiki

3 Jupyter notebooks

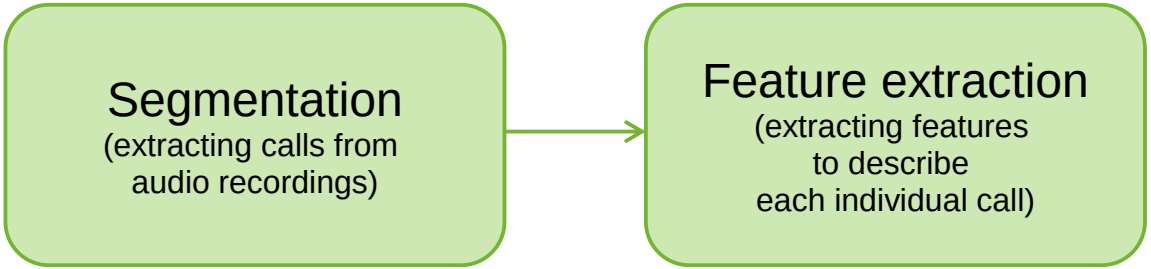

Analysis pipeline

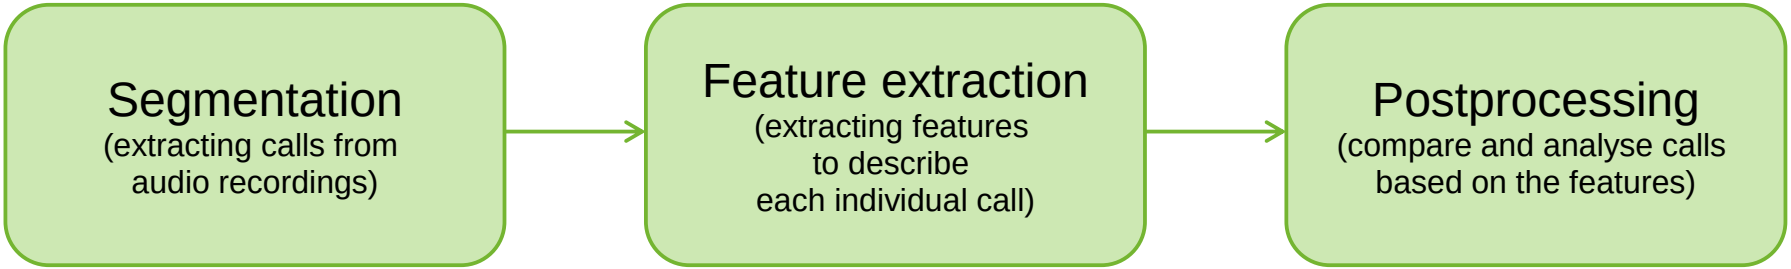

Segmentation
(extracting calls from audio recordings)

Analysis pipeline

Analysis pipeline

Segmentation

- Detect the relevant signals in longer recordings
- Can be done by hand or automated (usually with training on hand annotated data)

Segmentation

- Detect the relevant signals in longer recordings
- Can be done by hand or automated (usually with training on hand annotated data)

Tools:

- Audacity (free)
- Avisoft SASLab Pro (paid, free lite version)
- Raven (paid, free lite version)

Segmentation

- Detect the relevant signals in longer recordings
- Can be done by hand or automated (usually with training on hand annotated data)

Tools:

- Audacity (free)
- Avisoft SASLab Pro (paid, free lite version)
- Raven (paid, free lite version)

Model architectures (Stowell, 2022):

- ResNet
- VGG
- Custom CNN

Segmentation tools

Package	Language	Pros	Cons
DeepSqueak (Coffey, 2019)	MATLAB	Intuitive GUI	MATLAB-based (paid) Specialized in USVs
ANIMAL-SPOT (Bergler, 2022)	Python	Tested on several species	Setup can be tricky
BirdNET (Kahl, 2021)	Python	Actively maintained and updated Large number of bird species	Specialized for bird classification, potentially less useful for other species

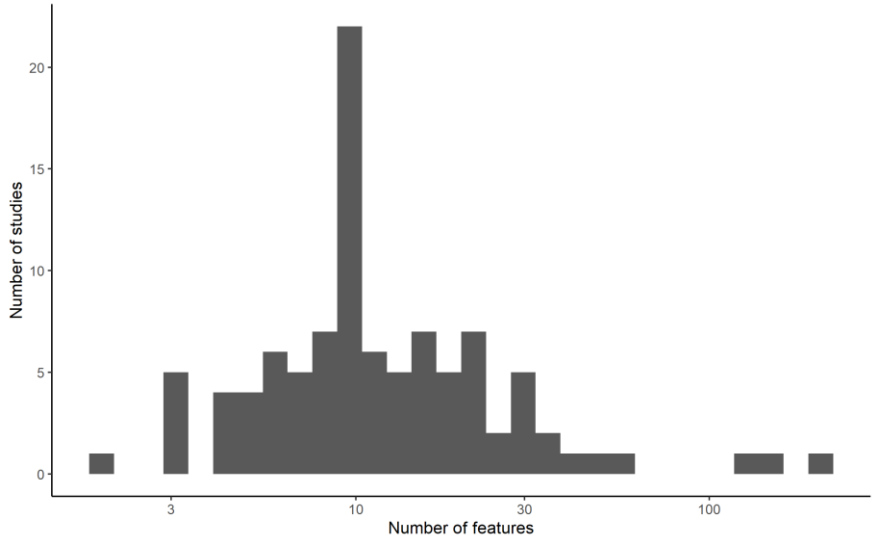

Feature extraction

- Describe sound in a small set of numbers
- Manual extraction vs latent extraction

Feature extraction

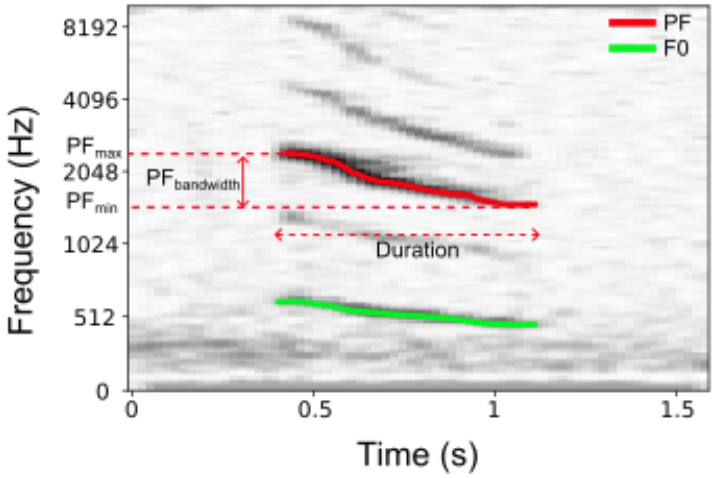

- Describe sound in a small set of numbers
- Manual extraction vs latent extraction

Grijseels et al (2026), Current state of bioacoustics research of vocal repertoires, bioRxiv

Non-exhaustive list of manual features

- Temporal (e.g. duration, time to maximum freq)
- Contour measures (F0, peak frequency)
- Spectrographic (e.g. minimum, maximum, center or bandwidth of frequency)
- Multi-unit measures (e.g. unit duration, number of units, inter unit interval)
- Other (e.g. entropy, amplitude, harmonics-to-noise ratio)

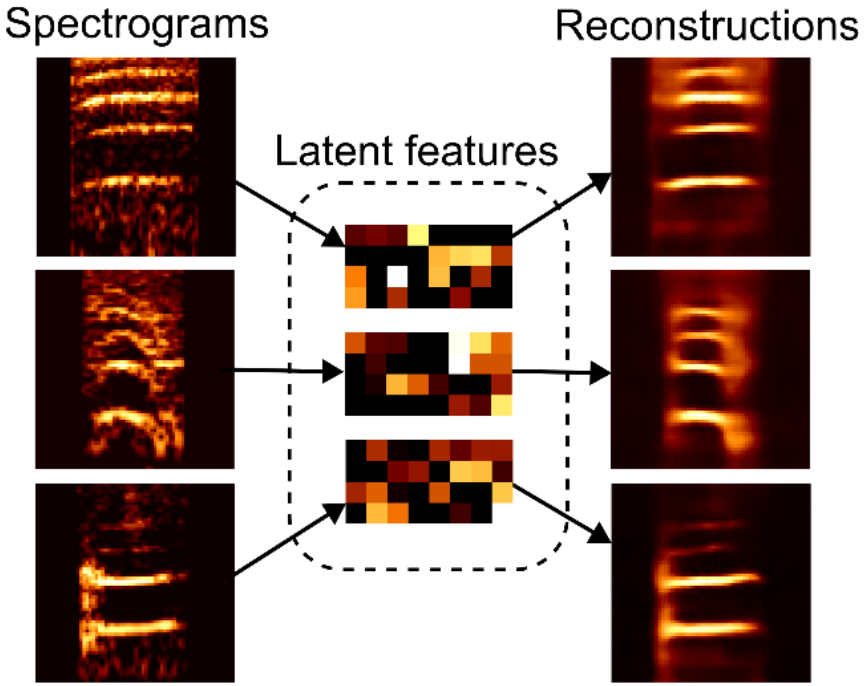

Grijseels et al (2026), Current state of bioacoustics research of vocal repertoires, bioRxiv

Latent features

- Infer features from raw data using dimensionality reduction methods
- Features do not clearly represent a single measurable feature (e.g. frequency)
- Several ways to do this, including autoencoder and DNN
- Resources:
  - Sainburg et al. (2020) – great overview paper
  - Thomas et al. (2022) – practical guide based on Sainburg paper

Latent features: autoencoder

- Input spectrogram as images of set size
- Pass through convolutional layers to downsample to the bottleneck
- Pass through reverse layers to upsample to original size
- Compare original to reconstruction and update weights
- After training, the bottleneck values are the latent features

Post-processing

Clustering

- Goal: find what calls are most similar to each other
- Many different methods available (see Wadewitz (2015) for discussion)

Classification

- Determine whether vocalizations hold information about certain feature
- Predicted feature flexible (e.g. call type, caller ID, etc)
- Again, many different methods exist

Practical workshop

Marmoset data from Lamothe et al. (2025)
